

This document will serve as the README for your copy of the Personal Information Processor. The Personal Information Processor is a way to efficiently process and display important personal information about your employees. The current version of the Personal Information Processor can process names, contact information, addresses, and basic educational data.

When you first open the application, you will immediately begin inputting a new person's data. You will first be prompted to enter a first name, then a last name. Ensure that you press "enter" after each entry prompt. Once you have entered a name, the application will then ask if the person you are inputting data for has contact information and an address, as well as an education. Ensure you answer yes or no to the contact and address prompt, and the education prompt. Answering yes to either question will prompt entry for their respective data.

If you answered "yes" to having educational data, you will be prompted to enter it in this section. You will first be asked the degree type of your person. Examples include associates, bachelors, or doctoral degrees. You will then be prompted to enter the institution of which your person attended, how many years they attended, and whether they graduated from said institution.

After entering basic education data for your person, you will then need to enter the mailing address of the institution. In order, you will enter the street address, city, state, and zip code of the institution. Completing these prompts will complete the educational section of the Personal Information Processor.

If you answered "yes" to the prompt about contact information, you will be asked if your person has a home phone number? If you answer yes, you will then be prompted to enter said home phone number. Afterwards, you will be asked to enter the cell phone number, then email address. After you have filled out the contact information page, you will be asked if you have address information. Answering yes will give you prompts to fill out the address section.

If you answered yes to having address information, you will, in order, be asked to enter a street address, city, state, and zip code.

After you have filled out all the prompts required, the Personal Information Processor will display all entered data in a concise format. It will first display the first and last name of your person, followed by any applicable phone numbers and email addresses, any home address entered. It will also display educational information such as the degree your person studied, the institution they attended and for how long, whether they graduated, as well as the mailing address of said institution.

The program will then ask if you wish to enter information for a brand-new person. Answering yes will restart the prompts all over again, to be filled with new data.

If at any time you leave a prompt blank, or for institution state and zip code specifically, the program will reject your data entry, and you will see an error. The program will then move onto the next prompt. If you wish to go back and enter the data correctly, you will need to restart the application. This property does not apply to entering the data for any home addresses.
